

EQUIVENTUS®

EIPH TREATMENT

EQUIVENTUS® EIPH TREATMENT is a bone marrow, stem cell derived product. EQUIVENTUS contains 44 different, mesenchymal stromal, stem cell secreted factors to help promote tissue healing. EQUIVENTUS nebulized airway treatment is only available through licensed veterinarians. Prior to treatment, an examination of the horse should be performed and documented. The protocol for use is described as follows:

- EQUIVENTUS comes in a 28 bottle treatment pack; the equivalent of one treatment protocol
- Treatment is administered over a 14 day period; 2 x 10ml bottles per day
- The horse being treated should be relieved from active, strenuous workouts or competition during treatment
- Each day of treatment consists of using one bottle in the first part of the day followed by a second bottle in the afternoon
- Each bottle takes approximately 5 minutes to administer
- The preferred nebulizer for use with EQUIVENTUS is the 'Flexineb 2'. This device allows the horse to be walked during treatment. Walking during nebulization is recommended, as it promotes natural inhalation by the horse and provides an easier route for the product to target the affected areas
- The full treatment course is recommended for the desired results on airway inflammation, lung fibrosis and EIPH

EQUIVENTUS is intended for airway indications associated with EIPH, Airway Inflammation and Intraparyngeal Cicatrix. By following this prescribed treatment protocol, this will help ensure the maximum health benefits of EQUIVENTUS for the horse.
